Some tutorials present an image-editing process by using series of actions. Photoshop CS6, which I cover in the next section, offers an action library in its Actions panel. See Book I, Chapter 6 for additional information on actions. The landscape and design industries, which employ graphic artists, use Photoshop as well. In some fields, Photoshop is regarded as essential. There are many free tutorials to help you become familiar with the application and learn how to make the most of Photoshop's features. Designing and manipulating images Photoshop can give you the power to edit raster images, which are sometimes called bitmap images. Raster images aren't true photographic images. Whereas the medium used to take a picture can be film or a digital sensor, raster images are based on your computer screen. The computer screen, in turn, receives a raster image from the digital sensor of your camera. Photoshop can also offer you options to manipulate the look of a vector image, a type of image that's based on mathematical formulas. A simple vector image can be composed of simple lines. However, when you take a look at it, a simple line has been replaced by a unique path that connects dots at varying intervals. Vector images are very similar to line drawings, but they are far more versatile and can be manipulated far more quickly and easily than line art. You can stretch, warp, group, and, in some cases, even color or add text to a vector image, whereas line drawings are restricted to lines. So although vector images can look smooth and raster images are sometimes called pixels, vectors can be used to look good on screen and raster images can be used to look good on paper. Like the rest of the world, you want to produce your best work in your chosen profession. The best way to become a successful designer, illustrator, or graphic artist is to master Photoshop. For more information on how to use Photoshop to edit your images and create artwork, check out the sections that follow. Editing an image with Adobe Photoshop Photoshop is a complex program, and you can't do everything in one step. However, it provides numerous tools and panels that make it easy to make changes to images. This section takes you through the basic layers panel, which enables you to move, resize, and distort your images. I also discuss using filters and applying adjustments. The Layers panel The layers panel is an important feature that

Zine-art work and the same range of stickers that I like to use in my artwork. I just made a new batch and already sold a zine! Do you create work using found materials? I usually find interesting things in the trash or the beach, so I use those to make art. For example, when I had a nice new copy of the East End artsy zine I made a graffiti zine in it! Also, this new zine I created had a nice ripped up Feathered Dog copybook. At the time I really liked that old dog, so I made a stencil in black marker on the outside of the book and framed that in the cover. What's on your work desk at the moment?I have this old brown wooden cutting board that my grandma gave me before she died. It is my workspace board where I cut out and paste up collages and lots of different images. It holds a lot of material I use as inspiration. Looking at some of your previous artwork, is there a pattern in the way that you work? It's probably the same way that I grow veggies. I sort of plan out how the plants will be planted and I get very territorial with them, just like how I am territorial with art. I'm always creating more zines and it seems to consume as much of my attention as possible. 1 comment: There is really some cool stuff out there, and we should get more stuff here, soon. The gallery space is ready, hopefully we can get our own space soon and move things there. I like this, you guys are doing a really cool job with this one.Q: Why is this code running mysqli_fetch_row more than once? I am trying to update my database, but I'm running into a problem. My problem is that I keep getting the same id of 2 twice. So basically I get the same row twice and I would like to get rid of one of them. My code looks like this:

Ethernet's popularity as a general-purpose network technology has grown in recent years, and is expanding in customer markets and applications. As Ethernet's deployment grows and the variety of network applications increases, demand for Ethernet bandwidth increases. As a result, a growing number of carriers are offering Ethernet services (e.g., Ethernet Frame Relay (EFR), Ethernet Asynchronous Transfer Mode (EATM), Ethernet Internet Protocol (EIP), Ethernet Private Line (EPL), etc.) to their customers, the number of service and network providers offering high-speed Ethernet services is growing, and the size of the fast-growing Ethernet market is increasing. To provide quality service, Ethernet service providers must ensure that the Ethernet networks they operate are fault-tolerant and scalable. Therefore, Ethernet service providers typically use Ethernet redundant ring topology networks. In particular, the Ethernet redundant ring networks typically include a number of nodes, where each node is a Frame Relay /Asynchronous Transfer Mode (FR/ATM) (or Asynchronous Transfer Mode (ATM)) or EIP Layer 2 (EEL2) switch (with or without EIP or EEL2/FR functionality) using techniques such as Routing Information Database (RID) backup and restoration, link state routing, and automatic protection switching (APS). APS is an approach to providing high availability for a group of links, nodes or sub-networks in a shared-risk environment. In a shared-risk environment, the shared risk of a network failure is borne by a service provider, and the network failure is characterized by a single redundant path from the communication source to the communication destination. In shared-risk environments, the network failure is a link or node failure, and not a link or node failure in one portion of the network and a link or node failure in another portion of the network. A failure in one portion of the network is usually referred to as a site failure. In a shared-risk environment, a primary path is assigned to a communication connection or session prior to commencement of communications, and the same primary path is re-assigned to the communication connection or session if a link or node failure occurs. In shared-risk environments, multiple paths are available between a source and a destination; only the primary path is always up and has the capacity available for use by subscribers of the service. If a failure of the primary path occurs, the redundant path provides backup capacity to maintain session continuity. If a failure occurs in one portion of a network
