Creating and editing features and symbols Symbols are used to communicate to the model. They are contained in classes such as Axes, Edges, Bounds, Subviews, and so on. Each type of symbol is a subclass of the symbol class. The drawing window of AutoCAD LT includes several buttons to initiate the creation of new symbols, (such as the symbol button and the symbol canvas window).

The edges and bounding box use the class Edge object, which inherits from the abstract class Object. The most basic class used to create edges is the Line object, which is a subclass of Object.

Several different kinds of line can be created, such as a line, a line bound by two points, a line bound by a specific point and an end point, a line with a specific length and thickness, and an arc of a specified length and radius. Other types of lines are used for special purposes, such as a diagonal line used to create a viewport for a section plane. Edges have an accompanying class EdgeStyle. EdgeStyle contains the properties of a line object. It is a subtype of the abstract class ObjectStyle. The Bound Box class is the basic container class used for displaying a bounding box. This class is derived from the abstract class Object. AutoCAD and AutoCAD LT use a drawing model with hierarchical drawing elements (including arcs and circles). These can be defined and

edited with the Circle object. The Circle object inherits from the abstract class Object. Other types of geometric objects such as arcs, splines, and ellipses can also be created with the Circle object. There are also several geometric functions (such as the function) used to create geometric objects.

Many other classes are available to create and edit features and symbols. For example, the Line object is used to create lines, and LineStyle is used to specify line properties. The Polyline class is used to specify polylines. Polylines can be used as markers and for polygon creation. Creating 3D objects and models The 3D objects such as models and drawings are created and edited using the appropriate 3D interface. The most basic 3D object class is the Block, which is derived from the abstract class Object. The model objects are derived from the abstract class Model. The drawing objects are derived from the abstract class Drawing. Creating a 3D model is done through the 3

INSTALLATION COMMANDS Autocad 2010

----- For full instructions on setting up Autodesk Autocad see: We don't need to do anything. If you did not already have Autocad installed you will be asked to download and install it. Once installed you will be taken to the web browser login screen. You can log in using your Autocad License Key (AUTO_ACAD_KEY). You only need to login once. If you are prompted to login again, then you have not yet entered your license key correctly. Just keep pressing the login button until you get to the web browser. If you get an error message saying something like "Bad login/pass", then you entered the license key incorrectly. Simply press the login button again and you will be prompted to enter the correct key. If you want to change your login or password, just press the "Settings" button, enter your login/password, and press the "Save" button. Autocad 2007
