Key features The following sections describe the various features of AutoCAD as it is available in the market today. Import and export AutoCAD supports import and export of data in several formats:.DWG,.DXF,.STEP,.DBF, and.SHP. The.DWG file format is the native format of AutoCAD for most of its features. The.DXF format supports import from many other CAD programs, including MicroStation, MicroStation VAX, and Revit. The.STEP file format is the standard format for AutoCAD LT, the entry-level version of AutoCAD. AutoCAD LT is ideal for people who do not have the need for large files or for more advanced applications. The.DBF file format is used by AutoCAD for large files and also by some of the commands that are not present in AutoCAD LT. The.SHP file format is used by AutoCAD for creating and editing map layers. File extensibility If AutoCAD is used to import.DWG files, you will also need to consider the AutoCAD DWG Importer file extension..DWG files can be found using the file extension search feature. This will also work for AutoCAD LT, and for other CAD programs that use the DWG file format, such as MicroStation, MicroStation VAX, and Revit. Some features of AutoCAD LT are not available in.DWG files. For example, layers are not visible or editable in.DWG files, and therefore are not supported in AutoCAD LT. AutoCAD LT also does not support some functions that are dependent on the.DWG format, such as import of feature attributes. The.DXF file format is also considered a DWG file. However, it can be opened in Autodesk CAD and can be edited. The.DXF file format

Does using "secure" incurs much security risk? Because it's not a good idea to use "secure". Just wondering. I feel its not a good idea to use "secure" rather than "ensure" or "make sure". Is there any security risks using "secure" or not? A: That depends on how secure you want it to be. You could say something like: The web server is fully secure. No unauthorized persons can see your files. I wouldn't go with The web server is fully secure. You could, but the context is going to be slightly different. The web server is fully secure. No unauthorized persons can see your files, but you must login to the web server to access the web site. You can use the same word for both cases, but the second one may be better to avoid any possible confusion. Q: Why is the result not as expected when using lambdas in `foldr`? I have this list of numbers: listOfNumbers = [1,2,3,4] I try to sum these numbers up and then return the maximum of this sum. My way of doing this is maxIntVal :: Int -> Int maxIntVal n = n >>= \(x,y) -> if x > y then x else y foldr (\(n,x) (acc,x) -> (n+x,x)) 0 [1..] However, this is what I get: [1,2,3,4] [3,4] [7,4] [10,4] [13,4] [16,4] [19,4] [22,4]
