Prior to AutoCAD 3D, AutoCAD 2D was used in the military and defense industries. This was based on the requirements of the company's existing architecture of having 2D CAD based on the work of Sir Christopher Alexander, which was renamed DANI (Digital Architectural Navigator) and used for the design of buildings in the UK and the US. DANI was available for the PDP-10/20 at a cost of £2,000, which was a prohibitive amount for the design of large projects. Weather Forecast 7:05 am Sun May 17, 2013 Artists to Pop Out of the Closets: What Do You See? When it comes to the development of a visual sense, there's something that's hardwired in every one of us - and that's creativity. But why do some people see images, and others don't? Most people agree that the early years of development involve more imagination and play than anything else. So an image-processing area of the brain in the cortex is called the primary visual cortex. So why can people with this area of the brain, but not other people, see images? A laboratory at the University of California at San Francisco, called the Sperry Clinic, is trying to figure it out by studying patients with brain damage. From their work, scientists now know that another part of the brain called the fusiform gyrus, is responsible for image recognition. That's why some people with damage to this part of the brain may not be able to recognize faces or read pictures. Doctors have used these tests to help patients like Peggy. She was diagnosed with prosopagnosia, a rare neurological disorder that affects the ability to recognize faces. In the video below, Peggy responds to drawings of faces. She's able to recognize parts of her own face. But she doesn't seem to know that someone else is the artist. The fusiform gyrus is a hub of activity where signals from the other parts of the brain arrive. So it's become a bit of a Rorschach test, measuring how much of the brain we are born with. It's a major pathway to the areas of the brain that process emotions. And there's more than one path to creativity. In this video, patients are asked to draw or paint a cat. Stanley Coren studies creativity and is a professor of psychology at the University of British Columbia. He says that the fusiform gyrus is only one of many pathways to creativity. And he says there are two types of people who can't recognize faces. "We have one group who can't recognize faces but can recognize other things. They can recognize a painted cat, for example, even though they can't recognize a person's face," says Coren. The second group can recognize faces, but they have no interest in art. For most people, the fusiform g
