A widget is a small part of a larger application that occupies a small area of the user's display, but which has a relatively large effect on the application's function. AutoCAD includes many special abilities that make it ideal for use in many industries and in many workflows. AutoCAD users may use it for: modeling or sketching a new or modified product, production or documentation of new or modified designs and prototypes, engineering models, structural design and documentation of a building, architectural or mechanical design. AutoCAD includes a tool for creating architectural and mechanical drawings, called ArchiCAD, which was available as of AutoCAD 2007. Also included in the new 2009 release of AutoCAD is the new Anyplace parametric modeling, which was introduced with AutoCAD 2009. AutoCAD 2013 introduced a graphical tool for tracing which can be used for generating mechanical and architectural design documentation. In general, AutoCAD and AutoCAD LT are the most commonly used software applications in the field of architectural engineering and architectural design. AutoCAD can also be used for mechanical engineering (MechCAD) and in survey work (SW). AutoCAD can also be used in the field of Architectural Technician and engineering, such as for Civil engineer. AutoCAD can also be used as a basis of a CAD (Computer-aided design) for non-engineering fields such as business, healthcare and home. AutoCAD is a drawing program and is categorized as a DIA (Drafting Information Architecture), in which the views used to create the drawing are stored in a drawing database. When a drawing is opened, the views are read from the database and displayed in a display. They can be organized into groups (catalogs) and combined with other drawings to create larger views. New drawings can be created by drawing on these views, whereas moving, enlarging, deleting or rotating views are handled by other software. Other items are represented by custom commands (for example, a line symbolizes a vertical partition of the workspace). A list of commands may be displayed at any time and shows what commands the user can use. In addition to the various views, drawings can be grouped in layers, which can be stacked or layering can be synchronized with the model. Other features include the ability to create and manage parameters (parameters can be selected from a drop-down list), edit and set attributes, create sets and groups, and plot coordinates and a1d647c40b
