I have a very simple code for example int main() { curl_global_init(CURL_GLOBAL_ALL); CURL* handle = curl_easy_init(); struct curl_slist *slist; slist = curl_slist_append(slist, ""); curl_easy_setopt(handle, CURLOPT_URL, ""); curl_easy_setopt(handle, CURLOPT_URL, slist); curl_easy_perform(handle); curl_slist_free_all(slist); curl_easy_cleanup(handle); return 0; } This code is not complete. I want to see if the web browser will be terminated when the server closes the connection with the client. This will happen at this line of code. curl_easy_setopt(handle, CURLOPT_URL, slist); If you want to have a real memory leak problem, try to run this code at least 3 times in a row a1d647c40b

Dectin-1 was also shown to be upregulated on circulating and intratumoural monocytes in melanoma patients compared to healthy controls and lung cancer patients ([@B31]). This was further supported by demonstrating a role for dectin-1 on the promotion of the M2 phenotype in macrophages ([@B35]). Interestingly, we also observed a significant reduction in the mean number of CD163+ macrophages in the blood and tumour in breast cancer patients. Although CD163+ macrophages are part of a complex system with multiple functions, they have been implicated in the tumorigenic process and neoangiogenesis through multiple mechanisms, including tumour-associated macrophage-mediated secretion of TGFβ, production of reactive oxygen species and the expression of a variety of pro-angiogenic factors ([@B59
