NoICE provides a graphic user interface tool that is designed to make the life of many QFP programmers and the hardware engineers much easier. This allows the programmer to enter and debug code at a higher level to a QFP embedded system. Hardware engineers can load a set of custom waveforms, communicate with the CPU and access system registers from NoICE. NoICE is a very small tool, which will run on standard computers. NoICE does not require any special hardware to run, so it can be used with bare and/or bare-boned boards. The graphic user interface supports the features of the CPU/FPU, I/O ports and memory, but also displays information about the CPU, FPU, I/O and bus signals. 32-bit Freescale K70OS Flash Utility OEM programmers may find it very useful to have the source code for the 32-bit version of FreeScale K70OS Flash Utility also supports the 60x series of Flash Memory controllers, as well as 32-bit and 64-bit NOR flash memory devices. The NoICE system offers a completely interactive environment with a command window, a command history and a set of help tools. The work area is divided into two main sections: a workspace where the control window is located and the execution window, where each command is executed. The workspace provides the control window where the commands that have been executed area listed and the history window where the commands are listed with their execution number, displaying the number of commands that have been executed already. The execution window is divided into three areas: the input area, where the commands, configurations and options are entered; the data area, where the command result is displayed and the selected data is displayed as hex words; and the output area, where the output is displayed as hex words or ASCII characters. The command history contains all the commands and their execution history. NoICE can also reset the target hardware if the user wants to run the same command again, and if the target has been in sleep mode. NoICE has been designed to be intuitive so it does not require any special knowledge to use. Intuiv3D is a visualization tool for 3D CAD models. Intuiv3D is designed to work with all well known CNC Machine Tools CAD-Models. Intuiv3D is written in Visual Basic.NET and utilizes Visual Basic.NET Forms to ease the creation of new forms. NoICE is a free debugger for microprocessors which allows the users to view the content of the memory and examine the registers of a target microprocessor. To facilitate the user's job, NoICE provides a graphical user interface that may be adapted to the users interface that may be adapted to the user's needs. In addition to the debugger capabilities, NoICE also provides the most advanced statistics functionality to the users. NoICE generates a detailed statistical report for each instruction executed. An Object Oriented Architecture for NoICE: NoICE is built upon a framework that supports the modular development of applications. This architecture enables rapid development of applications that reach the end users by delivering a well-proven, easy to use, useful, and reliable software product. The user interface, library, and application development can be integrated with the framework. NoICE also supports the built-in scripting language for creation of special tasks. NoICE has been tested to work on an 800 MHz Pentium Pro microprocessor. NoICE can be used to debug any microprocessor conforming to the Intel x86 family. NoICE includes a reliable user interface which may be adjusted to the target environment. For example, the general status bar may be replaced with a local display panel which is an option of the GUI. In addition, the local display panel can be configured to support writing to the screen using a language preferred by the developer.
