Please look at the time stamp on the story to see when it was last updated. A 17-year-old thug was taken into custody by cops after he slit a friend's throat and tied him to a wall. While climbing a 30-story building in downtown Los Angeles, the muscular teen's ladder slipped. The teen dove through his window to safety but landed in the path of another teen who was walking the ledge. The two

rolled around in mid-air before tumbling 30 stories down to the street. But not before the two met a violent end. The falling victim was stabbed several times. The assailant then jumped from the building. Before plummeting, he called 911 to report what he had just done and gave his location. Officers found blood spattered on the outside of the building and ran inside. The strong-arm slashing was an attempt to break up a fight in which the victim received a bloody gash on the back of his neck. Los Angeles' medical examiner's office identified the murder victim as Jason Javier Cruz. A Santa Monica resident, Cruz was not a gang member but was friends with one. During questioning, the suspect gave a detailed account of his murder attempt.Q: Application Insights - Tracking the source of exception I'm using Application Insights to log exceptions and errors in my application. Now, I need to understand the reason behind the exceptions which are logged. Is there any way to have the corresponding stack trace at Application Insights so that I can see the exact source of the exception. A: You can attach some custom event handlers to ApplicationInsights.Error event and then log/trace the event object in the handler. The event object should contain some information about the original exception and its stack trace. public class LogException : EventTelemetryProcessor { public LogException(TelemetryClient client) : base(client) { } protected override void Process(IEventSourceContext context, EventTelemetry item) 82138339de
