Linked drawings – Linked drawings, or multi-document files, make it possible to edit the drawings and drawings stored on network file servers. A person can open and edit one drawing and save it, without saving the other drawings. This can improve workflow and make a drawing editable by anyone who has access to the file. A Microsoft SharePoint drawing package can contain linked drawings. Templates Templates are a form of pre-defined drawing components that enable a user to design, create, modify and revise drawings without having to perform custom drawing creation work. Templates are grouped together

under a product or a category of products, and can contain a number of predefined drawing objects, such as furniture, text styles, symbols, page elements and drawing standards. Connectivity The program enables connectivity to third-party programs through either the 3rd party Data Navigator or through the import/export.dwg. Third-party Data Navigator connections are for third-party programs, such as database management software, file viewers, spreadsheets, text editors and other software that can be connected to CAD and other Autodesk software programs. Import and export Importing and exporting to the format used by the target program is easy. It may take a bit of trial and error, however, to make sure the drawings imported correctly. Importing Autodesk has made it easier to import and export drawings from Autodesk applications. An import process will generally prompt the user for what is being imported. It will then try to import the standard format for that drawing and if that is not successful, will prompt for what the user would like to use instead. If the import process is successful, the drawing is stored in the user's drawing library. Importing can be done via a manual process by using the Data Navigator and dragging and dropping the files into the program. It can also be done with a group of drawings by using the AutoCAD Window menu and selecting the Drawings option. Autodesk also provides an import and export tool within the application. This is located on the File menu and is called the Export or Import Navigator. It allows a user to select an Autodesk file format as well as the target program. For example, a DXF can be exported to DWG, DWF, etc. Batch editing Autodesk provides Batch Editing, which allows a user to edit multiple drawings. This is a utility program that a1d647c40b
