Just wondering if there is a way to "cut" a specified portion of a PDF - I can easily highlight and copy the text from the PDF that I wish to use but was wondering if there was a way to highlight the area of the PDF that I want the code to extract from.Q: Why downcasting is needed in the following code? I am new to java,so it would be really helpful if someone can explain what is the reason of casting Object to your expected type in the following code? Object object = (Object) clientResponse.getWrappedObject(); i.e. why does compiler throw an error in the following code? Object object = (Object) clientResponse.getWrappedObject(); if (object instanceof Integer) { Integer i = (Integer) object; } A: It has to do with type erasure - you can't always downcast because you don't know if the object is actually an Integer. clientResponse.getWrappedObject() could return an Integer object that doesn't have any additional information associated with it. When you cast it to Integer, it actually just casts it to Integer.TYPE (which is Object). So what happens if your clientResponse object doesn't actually contain an Integer. When you try to cast it to Integer, it will throw a ClassCastException. See the Java tutorial for more info. Q: Google Maps API - JS - Overlay with multiple markers Hi i am trying to figure out how i can implement some sort of jQuery plugin that allows me to add markers to a map with the info in them. My first attempt at this is the below. I have this working but it just adds one marker to the map rather than repeating the google map url multiple times with the different markers. function initMap() { var john = { lat: 51.521677, lng: -0.642329 }; var map = new google.maps.Map(document.getElementById('map'), { zoom: 12, center: john
