Angiogenesis is the process of formation of new capillaries from pre-existing blood vessels. It is a complex process involving many factors that are closely regulated (Carmeliet and Jain, *Nat. Rev. Genet.*, 6, 847-857 (2005)). During development, angiogenesis promotes organ maturation and proper function by supplying oxygen and nutrients to the growing organs. The process is also involved in the re-vascularization of wounds such as burns or ulcers. In adults, angiogenesis is involved in several physiological processes including menstrual cycle, embryo implantation, development of the placenta and formation of the corpus luteum and retina. Angiogenesis also plays a critical role in diseases, particularly in cancer. In the latter setting, tumor-induced angiogenesis provides an essential path for tumor growth, and promotes the development of metastasis. Angiogenesis is involved in the growth and metastasis of gliomas. Brain tumors are the second leading cause of cancer death in children under 15 years old, and malignant brain tumors have a poor prognosis (U.S. Dept. of Health and Human Services, National Cancer Institute (1999), Pediatric Brain Tumor Foundation, www.ptf.org/). This poor prognosis is due to the inability of many tumor cells to leave the primary tumor mass as well as the recurrence rate of brain tumors in 50% of cases, despite aggressive therapies. However, brain tumors seem to rely on the continued formation of blood vessels to survive, grow, and disseminate. Most brain tumor cells are of endothelial origin, and new blood vessel formation is critical for brain tumor angiogenesis and growth. Several factors secreted by brain tumor cells, such as vascular endothelial growth factor (VEGF), fibroblast growth factor (FGF), epidermal growth factor (EGF), transforming growth factor (TGF), platelet-derived growth factor (PDGF), angiopoietin-2 (Ang-2), and stromal cell-derived factor-1 (SDF-1), promote new blood vessel formation (Bergers and Benjamin (2004), *Nat. Rev. Cancer*, 4(10), 727-737). It is now well accepted that neovascularization occurs by sprouting and branching of pre-existing blood vessels and this is the main mechanism underlying new blood vessel formation in response to ischemia (Risau and Shweiki (1992),

Near Orbit Near Orbit is a science fiction novel by American writer Kim Stanley Robinson, published in 1989. Plot introduction Near Orbit is set during the late 21st Century. The author is a near-future archaeologist. The book begins with an introduction to the new galactic political and economic alliances the author and his protagonist become involved in during their trip around the galaxy. Plot summary The book follows the career of Pekka Tiemisten, a Finnish-American astrophysicist and near-future archaeologist, who sets out on a mission to investigate the Precambrian Era-level remains of an early alien civilization, on the far side of the galaxy from the Milky Way, and starts a long journey to find out whether the ruins really represent a "new frontier" for human exploration or if they have all been artificially created. The first half of the novel is set in the orbits of the terrestrial planets, where an archaeological expedition is investigating the ruins of a civilization that had left behind enigmatic artifacts. On Earth, the ruins of several millennia before have also started to affect the lives of people living around them: over the past years, the tides have increasingly become unreadable, the population is falling, and something even stranger is happening to the young. Meanwhile, in an orbit around the Sun, a "near-orbiting joint expedition" including all major powers starts to investigate the ruins, in particular to find out if they were the result of an ancient alien civilization or are artificially created. On Earth, the first signs of xenophobia appear: the world's governments are discussing how to respond to the "threat" of the alien ruins, and the political landscape is shifting, with particularly powerful or fanatical groups taking advantage of the situation. The plot then follows a mission to Venus to investigate the Martian ruins, and an expedition to Mercury to investigate the ruins of a now defunct (40,000 years ago) ancient alien civilization. The protagonist Pekka and his allies begin to suspect that the artifacts that they are studying on Mars have been designed to be the "excuse" for the construction of a hyper-advanced "Thule machine", a device first discovered on Saturn, some thousands of years later, by an equally advanced alien civilization. After their discovery, the Thule machine was taken back to Saturn and used to extend their empire to the stars. Structure The novel is written in several parts, which are divided into chapters and sub-chapters.
