AutoCAD is one of the most popular and widely used design tools in the world. It is used for a variety of purposes including architecture, engineering, construction, home design, mechanical design, landscape design, and transportation engineering. AutoCAD is used in products ranging from automobiles to nuclear power plants. AutoCAD History Autodesk started the AutoCAD Project in the 1980s to create an integrated drafting system. The first version of AutoCAD was released in December 1982. The software was initially used in the AutoCAD User Group, with the idea that the software would allow individuals to work together on projects in the same room using a common set of file formats, commands, and drawing conventions. When the release of the product was complete, Autodesk took it to the general public. AutoCAD is considered an inexpensive alternative to other high-end CAD systems. The first version of AutoCAD was created as a desktop application, originally running on microcomputers with internal graphics controllers. Subsequent versions, including AutoCAD 2007, were rewritten as a browser application using a standard Web browser. Most commonly, users run AutoCAD online and download the design data as an electronic drawing, which is saved locally and then edited and redrawn offline. Early versions of AutoCAD were designed for use by architects, engineers, and draftsmen, and later versions extended their market to include architects, engineers, contractors, and other professionals working in various disciplines. The design was simplified from its original clunky appearance, with the addition of features that made AutoCAD easier to use. The early versions of AutoCAD only supported the line, circle, rectangle, polyline, and arc tools, and each tool had a dedicated command. The drawing was organized in a flat plane, but an x-ray and cross-section view were available. Any changes made to a drawing were tracked in the user's drawing history, and a find function enabled the user to return to previous states. Design features include parametric dimensions and blocks, including Assemblies, Angles, Attachments, Components, and Cross Sections. Design elements such as Properties were also added. It was possible to copy an existing drawing and paste it as a new drawing. AutoCAD was bundled with a number of additional drawing and drafting software packages, including blueprinting software, mechanical design software, and dimensioning. The software was also bundled with a

The amount of data available in the fields of music and video has increased tremendously. Consequently, various services have emerged that provide users with information, search, and collection tools. These services typically allow users to search for information on an item, such as a song, album, and the like. The services may also allow users to receive information about an item, such as playlists of related items or collections of items. However, the amount of content available on such services may be unmanageable for some users. For example, a user may receive a notification that a new item (e.g., song) is available and wish to receive a daily or weekly update about this item. In addition, the user may wish to receive information, such as recommended playlists of related items. Further, the user may wish to learn more about the item, such as sample audio. Although the user may be able to use a search engine, the user may not have the time or skill to properly formulate a search to enable results containing the information the user desires. To alleviate this problem, some services attempt to learn information about the user and/or the user's interest. For example, a service may query a search engine to determine information about the user. However, the search results obtained from the search engine may not be optimal. In addition, the search engine may not be able to identify information about items that do not exist, which may result in a user receiving content that is not appropriate for the user. Furthermore, recommendations, such as the aforementioned recommendations for playlists, may be provided based on content items that the user has already viewed. As such, a user may receive recommendations that
