AutoCAD is a highly powerful and widely used application, but many users can benefit from understanding how AutoCAD works and its overall architecture, which is complex. For example, it has many features that may appear to be arcane or overly complicated, but are actually very important, and many users (whether contractors or professionals) can benefit from such understanding. In this article we will describe this design and development process for a specific type of AutoCAD feature, an extremely common example of an AutoLISP function. We will also show the basic implementation of the AutoLISP function, which is also applicable to many other features. AutoLISP is an Autodesk-developed language that was introduced in AutoCAD 2003. The main goal of AutoLISP was to create the programming environment for creating custom tools for use with AutoCAD and other applications. Since then, AutoLISP has grown into a useful language that is widely used in various applications and products. What Is AutoLISP? AutoLISP is an Autodesk-developed language that was introduced in AutoCAD 2003. The main goal of AutoLISP was to create the programming environment for creating custom tools for use with AutoCAD and other applications. Since then, AutoLISP has grown into a useful language that is widely used in various applications and products. AutoLISP is a programming language that uses a declarative approach. It uses code blocks that are called with keywords. This is in contrast to the imperative approach used by most programming languages. In AutoLISP, the code blocks that define the function, class, procedure, or other type of block are called using special keywords, while statements are used to define and call the blocks that implement the block type. This language has advantages that include:

- Dynamic code creation. Code can be generated automatically by using expressions and keywords. This capability gives the developer the freedom to write custom code, which can be combined into a single program.
- Dynamic changes of language elements. The developer can redefine any of the elements that are specified in the code.
- Easy handling of fonts. Fonts used in the language can be assigned to any language element using the `SET` statement.
- The ability to change the behavior of the program without changing the source code.
- Direct access to the objects. The developer can access directly
