It was caused by a link, so don't click on it, and don't skip down the post if you plan to play a game. The issue I had was caused by a Mac machine accessing a Windows one over the LAN, and it was caused by the browsers, not the OS. The problem is that when I have two browser windows open, if I save a file (like a document), then one browser has to read the file, and tell the other browser what to do with it. The browsers I have installed are Chrome and Firefox, with both installed on my Mac, and both installed on my Windows machine, as well. The browsers are the same. When I open one browser (on Windows, I use the Chrome browser, on Mac, I use Firefox), the link to save the file has the file name added as a query string to the file name. So if I save the file "foo.ext", the browser makes the link to the file "foo.ext?foo=bar". It adds the query string, and it passes it to the other browser, which (if it is Firefox) will search the file for a query string, and return the file in the order it was requested. This is why you can't use the Google File System to access the file system on another computer. It turns the query string into a path, instead of just returning the file. The OS's file system paths are all well-formed, but they do not understand query strings ca3bfb1094
