To investigate the mechanisms of sulfonamide resistance in Enterobacter cloacae. We identified sulfonamide-resistant colonies on plate media, and then used PCR to identify mutations in two key genes, the dihydropteroate synthetase (Sul1, Sul2) and dihydrofolate reductase (Dhfr), which are involved in the synthesis of the target enzyme, dihydropteroate synthetase (DHPS). For validation of the results of DNA sequence analysis, we measured the kinetic parameters of the target enzyme (Dhps) using nitrocefin as the substrate, compared the rates of cell growth and tetrahydrofolate (THF) reduction in E. cloacae wild-type (WT) and mutant strains, and examined their susceptibility to trimethoprim (TMP) and sulfamethoxazole (SMX) to evaluate the possible occurrence of cross-resistance. Sul1, Sul2, Dhfr and Dhps mutants were detected in 17.7% (21/117), 2.6% (3/117), 24.3% (29/117) and 23.9% (28/117) of the E. cloacae isolates, respectively. In order to validate the results of the DNA sequence analysis, we obtained the kinetic parameters of the target enzyme
