Downloads “First, there are many species that are not what they appear to be,” Bernard said. “For example, when we were researching the reddish-brown color of a particular species, we found out that it was actually more a mix of different colors.” Although Bernard explained that the average species on Earth is not a symmetrical or upright creature, it is “not too bad in our eyes. It’s very well-camouflaged.” He says that was the case with the dolphins the team observed in the water. They appeared to be fairly well-camouflaged species. But after analyzing the DNA of their teeth and skin, researchers concluded that they were actually spiny-toothed dolphins that had a large proportion of the bottlenose dolphin in their makeup. When they returned to the water to follow the spiny-toothed dolphins, they also observed species of fish that have a singular purpose: species that specialize in eating marine cephalopods, or octopus, squid, cuttlefish and similar invertebrate species. One species of squid, for example, is called Nautilus from an Old Latin word meaning “nautilus.” It is so named for its habit of folding its arms and resting on the sea floor, “flashing” its ink at any predators that swim by. Nautilus, Bernard says, also live in groups, just like the dolphins. They live in “islands” or groups of animals connected to one another by a long stalk of muscle and nerve that keeps the group moving. “They are not flitting along the ocean floor,” Bernard said. “They don’t move along very fast. They use just their legs and they move slowly because they need to be able to fold up their arms and rest on the bottom.” In fact, Bernard said, in many ways, what they observed was similar to what is happening today
