I have a dataframe which has the following schema: StructType(StructField(a, IntegerType, true), StructField(b, StringType, true)) I want to group this by a, the dataset is like so: a b 1 a1 1 b1 1 b2 2 a1 2 b2 and my final output (where A==a, B==b) is: a b 1 a1 1 b1 1 b2 2 a1 2 b1 I've been trying to use a join in order to have something like that, but that doesn't seem to be possible. A: As per the SQL Algebra, SELECT can not be used if there is multiple expressions in FROM or WHERE clause or partition clause, this will lead to error. If the selection can be expressed with a where-clause, than a WHERE-clause shall be used instead. [source] So, in your case, you can achieve this using window functions. One solution is the following: val df = Seq((1, "a1"), (1, "b1"), (1, "b2"), (2, "a1"), (2, "b2")).toDF("a", "b") val df2 = df.withColumn("a2", "a") .withColumn("b2", "b") .withColumn("group", when((col("a") + 1) === (col("b")), col("a"))). groupBy("group", col("a"), col("b"), col("a2"), col("b2")) .withColumn

Neptunia Virtual Stars - WACTOR Pack Features Key:

The game works great with mouse and keyboard.

You won't be sorry for playing it!

256 scenes!

QuantumBreak: A 50 level shooter game that offers you lots of hand-to-hand and gun shooting action.

What's new?

- Experience the game's new controls.
- Play the scenario mode to select your best avatar.
- Play 6 challenge missions to overcome all kinds of enemy and hazardous situations.
- New Special Edition!

Controls

You can play QuantumBreak on keyboard and/or mouse. The game supports all keybinds to be set according to your favor!

Keyboard controls
