What's New in This Release: • Redesign for the user's convenience • New option to test the setupSurgical management of popliteal artery pseudoaneurysm following bone marrow transplantation. Pseudoaneurysm (PA) following bone marrow transplantation has not been reported. Since June 1990, eight cases of PA following bone marrow transplantation were managed at our institution. In this report we review our experience and discuss the factors which predispose to PA formation. Seven of the eight cases involved the popliteal artery. A history of prolonged fever, elevated inflammatory markers, and peripheral vascular insufficiency were observed at a median of 50 days (range 37-130 days) prior to the diagnosis of PA in all patients. Positive blood cultures and an elevated sedimentation rate were present in only five cases. There was a tendency for PA to form in the long femoral artery in patients undergoing marrow transplantation, resulting in limb amputation. There was a single fatal case of staphylococcal septicemia. In the remaining seven cases, therapy consisted of proximal or distal thrombectomy or both, and the presence of an active septic focus was a contraindication for operative therapy. Based on our experience, we conclude that patients with a PA following bone marrow transplantation, particularly if they have lower limb involvement, are at high risk for limb loss. Proximal or distal thrombectomy alone may be ineffective and should

be followed by fasciotomy. Repeat thrombectomy or thromboendarterectomy may be required if the swelling recurs. Thrombectomy combined with antibiotic therapy may be useful in the treatment of PA following bone marrow transplantation. } // Determine row and column if (!m_showRow) { if (m_currentVertex!= null) {

The Story - This is the story of the PC, with all the peculiarities that the human brain has created out of nothingness. The internet was created. It was a way to share ideas. It was like a book. But it lacked pictures, didn't it? So the internet was born. And it was fantastic. It was so good, that it wouldn't stop evolving. Until finally... The point is, after many, many years, the internet had become bloated. It was big, ugly, expensive, and it needed all the space in the world. The PC was jealous. 2. THE BIG BANG - A great PC like the internet can't continue to evolve. The internet has grown beyond anything it could have imagined. We had to take it down a peg. Now, it's time for a whole new kind of evolution. Today, I'd like to share with you the next big thing in computing. It's all about the internet, but it's also about something you've never seen before. It's called technology. You can imagine it as the internet on steroids. With technology, we're able to think bigger. We can create new things that couldn't have been imagined. But I won't bore you with the details. I'm sure you all know enough. 3. THE GUI - It's the thing most of us have come to accept. It's the way of interacting with the PC. But we were never actually satisfied with it. There was always something missing. So I started thinking about the matter. And I thought about the future. 4. THE NEW PC - In the future, it'll be a PC. A PC that's not only graphical. A PC where you will have the freedom to choose how you interact with it, where you can live without advertising, where there's no forced licensing, no constant update updates, nothing. A future where everything is free, and everything is yours. It's not a dream. It's the future. And finally, the moment you've all been waiting for.

[IMG][/IMG] Shutdown Windows the easy way The only thing you have to do after you run Quick Shutdown Menu is to click on the option you want to apply. You can shutdown or reboot, or let the computer hibernate or sleep, depending on which option you are choosing. You also have the possibility to access the system tray menu and lock or log off the current user. Exit applications The other thing this application does is letting you exit some applications from the tray. As you can see from the screenshots, this feature is useful for those people who want to close a program without having to go through the entire program's interface. For example, if you want to close the Explorer window, you only have to click on the application's tray icon, and QSM will exit all its components. How it works Now for the important stuff. After selecting any of the available power options, a dialog will appear informing you what has just been performed. The application works on any edition of Windows 8, starting from.1 to 8. Quick Shutdown Menu Limitations: It's important to emphasize that Quick Shutdown Menu will only work if you are using the standard shutdown dialog (i.e. when you press the Shut down option from the usual Windows 8 menu). It won't work if you are using the standard shutdown notification (i.e. when you press the Shut down option from the Windows log off menu). It will only work with Windows 8, 8.1, and 8.2. You cannot enable or disable the system tray icon. You cannot use the Advanced functionality, i.e. to hibernate the computer or restart it. It is not compatible with any of the other power options. For example, you cannot hibernate the computer or restart it through the 'Sleep' menu. What you can do The application was released in 2013, so it's a bit old. Nevertheless, you can still use it to power off your computer the easy way. The program only provides a menu with all the power options available to you, so you don't have to perform manual steps. Although this application may seem a bit old, it still performs its functions as advertised and does them in a neat and clear way. Our verdict: In general, we really like how this application looks, but feel that it could have shown more originality and functionality. Nevertheless, all the power options are clearly displayed to you, allowing you to
