It was announced on August 2, 2017 that Google and Yash Raj Films would produce a Pacific Rim reboot with the first official promotional trailer for the film released online on the same day. On January 17, 2018, it was announced that following the box office success of the first film, an animated sequel entitled Pacific Rim: Uprising would be released on February 24, 2018. The United Nations recruits skilled robots, called Jaegers, to fight Kaiju, monstrous creatures that have arisen from Okoto, and have gained sentience and the ability to evolve, making them nearly unstoppable. The film features a roster of familiar characters, including Idris Elba, Charlie Hunnam, Ron Perlman and Jake Pentecost, as well as new characters voiced by Blake Kolanus, Burn Gorman, Dennis Ingram, Kathryn Newton, Meghan Ory, Karl Urban, Tara Strong, and Diego Boneta, among others. The film is written and directed by anime director Guillermo del Toro, based on his script for the first film. The film marks a departure from the first film's focus on the human-robot war. Paul W. S. Anderson, who directed the first film, was not involved in the production of the film. Del Toro felt that Anderson was not a fan of his work and was unable to contribute to the sequel. Del Toro relied on his own ideas for the characters and the new story. The film's action elements were designed to be more visually appealing. Digital media del Toro observed that as he was writing the first film, he wanted something visually spectacular, but was unable to find a suitable technique to convey the ideas that

Watch online, direct link for Pacific Rim: Uprising (2018) movie in Best Look with movie synopsis "The evil Kaiju forces turn their attention to the human-created monsters". The present invention pertains to a process for preparation of cathode active material for lithium secondary batteries. Lithium-ion batteries are being widely used for a hybrid electric vehicle, an electric vehicle, a power storage system for home use and industrial use. A lithium-ion battery includes a positive electrode, a negative electrode, an electrolytic solution, and a separator. Each electrode is formed by coating a positive electrode active material and a negative electrode active material with a binder and then applying the mixture to a current collector such as a foil. As the negative electrode active material, a material that can occlude and release lithium ions, such as a carbon material, a silicon material, and a tin material, has been used. As a positive electrode active material, a lithium-containing transition metal compound such as LiCoO₂, LiNiO₂, and LiMn₂O₄, has been used. As such a lithium-ion battery, there is known a device including a heat dissipation member to prevent heat from generating in a battery cell, and a safety valve to shut off a current from flowing in an abnormal state of the battery cell. As such a safety valve, a structure using a spring-loaded metal disc and a pneumatic structure using a rubber air bag are known. In the lithium-ion battery, if the air pressure of the air bag is increased, the air pressure is applied to a metal plate through the air bag. Thus, the current is shut off. In the case of the lithium-ion battery, the air bag is installed in a larger side than the current collector. The air bag is constructed by an air bag and a surrounding member. The air bag is constructed by an air bag, a thin metal plate, and an elastic member made of silicone or the like. The surrounding member is also constructed by a thin metal plate and an elastic member made of silicone or the like. The thin metal plate is fastened to the current collector with an adhesive agent or a heat-resistant tape. Patent Document 1 and Patent Document 2 disclose a lithium-ion battery including a current collector, an electrically conductive connection member, an air bag, a thin metal plate, an elastic member, and a
