This article shows how to create and use a temporary table in SQL Server 2008 R2. The ability to use a temporary table is essential for the right management of SQL Server databases. Temporary Tables A temporary table is a view that works as a permanent table. You create a temporary table as a result of an SQL statement, such as: Create Table Create Table t1 (pk int, col1 varchar(10)) Now, you can create a table or view that is a copy of a temporary table. To do this, you need to create a new view using the CREATE AS SELECT statement. This statement is used to create a

view using a temporary table as the source. CREATE AS SELECT CREATE AS SELECT This statement uses the SELECT statement to create a new view, in this case named t2, using the contents of the temporary table t1. The CREATE AS SELECT statement allows you to use a temporary table for querying a database, even if it has already been removed. To use the CREATE AS SELECT statement, the destination must not be specified. Use of Temporary Table/Views A temporary table/view is useful to store information temporarily that is currently unused by other tables. Examples of temporary tables are the data stored in the temporary table system tables. You can use temporary tables for several purposes, such as to analyze experimental data. To use a temporary table, you must first create it. After that, you can use it as any other view. If a view was created using a temporary table, you must first drop it, to remove the influence of the temporary table on the view. Creating Temporary Tables You can create a temporary table in the following

This sophisticated application supports you with a large variety of tools that you can rely on to run multiple stress tests. You can begin your tests without much hassle, as you can start simulating scenarios, and you can test many different benchmarks at the same time. Moreover, you can use one of the pre-defined scenarios, or you can create a custom one, by using the provided function that would enable you to define certain settings, which will then be used to run simulations. Using the stored procedures that are generated in the In-Memory OLTP Simulator application, you can add all the required columns into the result set of the performance analysis reports that will be generated. You can also create some changes to the generated databases by executing SQL scripts, such as adding a trigger, or by changing some indexes. Of course, you can also retrieve performance analysis reports. This application is smart

enough to create database scripts and processes that would guide you through the simulation steps. So, you will be able to test the server capabilities quickly, if you do not want to edit anything. All of the aforementioned features make In-Memory OLTP Simulator a reliable application that would allow you to perform stress tests and test the capabilities of your servers easily. While performing such tests, you can view detailed information related to the status of the simulation, resources consumed, report contents, as well as performance analysis reports. Advanced In-Memory OLTP Simulator by Rapid7 Based on Microsoft® SQL Server® 2014 In-Memory OLTP capabilities, Advanced In-Memory OLTP Simulator is a powerful utility that provides server administrators with a wide variety of tools that they can rely on to perform various stress tests. Developers can benchmark SQL Server 2014's In-Memory OLTP engine without great efforts by simulating various real-life scenarios or loading several workloads. The application comes with multiple preset scenarios, but, for more in-depth management, users can create custom ones, according to their needs. Additionally, it is also possible that they can retrieve comprehensive performance analysis reports. More so, server administrators are provided with a handful of reliable functions that allow them to test the capabilities of their servers further and modify certain parameters, as it generates detailed reports related to resource consumption during simulations. For instance, In-Memory OLTP Simulator can be easily used for adjusting the allocation of certain resources, as it generates detailed reports related to resource consumption during simulations. While running simulation scenarios, users can target various workloads, such as Disk-Based or Memory-Optimized (with or without Natively Compiled Stored Procedure). The former implies storing tables within the disk storage while the latter relies on loading and processing selected tables in memory (with or without using natively compiled stored procedures). This application allows users to connect to SQL Servers with ease and generate databases that they can rely on to test certain capabilities. After connecting to the newly generated database, developers can begin benchmarking the servers by running simulations, by either choosing the most suitable one from a list or defining a new one. What's New in the In-Memory OLTP Simulator?

In-Memory OLTP Simulator is a powerful utility that allows you to perform real life OLTP workload scenarios in a simulated environment. You can choose from a variety of scenarios to simulate real life situations. Different workloads, such as Disk-Based and Memory-Optimized, can be chosen for simulating the performance of the In-Memory OLTP engine. The application can also be used to load Test Data with predefined scopes. In case, you have a customized table creation script, you can simply use it as a data source to load data in the database. With a click of a button, the selected data will be loaded in your database. The SQL Server Business Intelligence Studio can be used to analyze the data that has been loaded. You can also save the scripts in the database for future use. You can use the In-Memory OLTP Simulator to generate a report. Click the Report button to generate and save a report of your workloads. The report contains a snapshot of the performance of your database. You can run this report several times to find data points that can help you better tune your
