Like chameleons, Indian scientists have taken to new heights - displaying uncanny powers of adaptability to various aspects of life - when it comes to changing their specialty. Take the case of Dr. Rachit Gupta, a post-doctoral fellow at the Centre for Cardiovascular Sciences in India who switched from researching blood platelets to studying toxin function in nerve cells. Or Dr. D. Sivakumar, an expert in the field of automated cell imaging who shifted his research interest to pain medicine. Or Dr. Arul Chinnakanchi, the top gastroenterologist in India who decided to give up the gastroenterological practice and start working on microalgal fuel cells. All of them have switched their research fields - and many of them have switched their specialties in the same hospital where they already worked. Such diverse fields as research into blood platelets, nerve cells, pain, microalgae and fuel cells are not even in the same league. But their malleability is fascinating because it gives them the ability to move from one to another within the same institution, which is commonly seen as the domain of a particular specialty. "This'malleability' of our scientists is what makes India shine" said Dr. Santhi Vijay, director of the National Centre for Biological Sciences. "These are the ones who are such a joy to work with. These are the ones who can keep going no matter what," he added. Story continues below advertisement Dr. Gupta, who is studying platelets, recently discovered that a citrate molecule is removed from the platelets during the diagnostic process, leading to unpredictable results. "They have to be careful when they perform the tests because they can get involved in the modification process," she said. And Dr. Chinnakanchi, who was earlier a gastroenterologist, has started working on microalgal fuel cells. He is the expert who is currently trying to fix the massive electricity theft that plagues the city of Bangalore. "I always wondered why people steal electricity," he said. He now builds small devices that would capture the electricity that would normally go to waste when a power outage happens. He would like to develop these into solar-powered lighting devices that could be installed in homes and neighbourhoods. "It is a very small step, I know. But I think technology is the only tool we have to solve the problem," he
