Severe exposure to vibration can cause harmful health effects. The objective of this study was to investigate the potential recovery effects of rest and to assess the severity of acute fatigue on heart rate and electrocardiography (ECG) parameters in healthy volunteers during repeated high amplitude vibration. The exposed group of 36 men (mean age 21.4 years) participated in the study. The test subjects were exposed to 6.0 Hz and 0.65 g rms static acceleration for 5h to repeated whole-body vibration (pWBVV) with the use of electronic gates. ECG values, including heart rate and corrected QT interval, were recorded at the beginning and at the end of each work shift. A second group of 18 healthy men (mean age 21.1 years) participated in the study as controls. These subjects were exposed to continuous work for 12h. The following ECG parameters were recorded during the work shift: heart rate, corrected QT interval, QTc (corrected QT interval), the T wave (normalized T wave; NT, calculated by the authors), and T/QT. A software program was used to generate statistical averages for each subject. Statistical comparisons between exposed and control groups of subjects showed a significant difference between the groups in the corrected QT interval, corrected QTc, NT, T wave, and QT at the end of the second shift. Analysis of heart rate dynamics revealed that three individuals were found to be at high risk of heart disease. These results showed that the test was successful. Heart rate dynamics analysis can provide useful data for determining the potential risk of heart disease in human subjects.Q: Prove convexity of the function $f(x)=\frac{1}{x^3}$ How to prove the assertion? How to find a function of the kind $\frac{1}{x^3}$? c6a93da74d
