effects on the brain were made according to the european pharmacopoeia hypokinesia. in these models, both m. sativa and calcium channel blockers have been found to exert efficacy in the treatment of neurodegenerative diseases such as parkinson's disease, dementia, alzheimer's disease, mental diseases, and depression. in addition, in a clinical study, the combined intake of m. sativa with calcium channel blockers reduced the urinary amount of the waste product of cholesterol metabolism, both in the source and in the target organ (i.e., the kidneys) compared to calcium channel blockers alone (turecek et al., 2006). in a recent meta-analysis, the use of m. sativa extract as an adjuvant for various neurological disorders was examined. the authors found only a small benefit of low-dose m. sativa over placebo in minor anxiety symptoms (thus with rather high likelihood of a type ii error) (brückenjürgen et al., 2011). this benefit was independent of adjuvant treatment with a benzodiazepine or a non-benzodiazepine. the spectrum of the constituents in m. sativa is surprisingly broad as it can be found in all parts of the plant, such as seeds, seedlings, aerial parts, and fruits. we have detected high contents of trans-n-feruloyltyrosine (about 45%) and the butanolic fraction of the extract (about 2%) as active components. however, the content of other important active constituents may vary from one area to another. furthermore, the ratio between the different active constituents is influenced by genetics and environmental factors (turecek et al., 2006).

government of india 's centre for medical research (icmr) has developed evidence-based safe drug use guidelines for adult populations. the most recent guideline was issued in 2017 [32] and the long-term care guidelines are currently in the process of

publication. this underlies the problem of the increasing resistance of these organisms against vancomycin, glycopeptide antibiotics [35, 36, 37] since they are commonly used in the management of healthcare-associated infections associated with indwelling central venous catheters. therefore, newer antibiotics are being developed for these infections and these are likely to change the future trends in the microbiology of these infections [38]. increasing resistance of enterococci to extended-spectrum penicillins (esp) was also shown [39, 40]. there are several guideline documents that have focused on the hospitalised patients [29, 40, 41] and the outpatient management of candidiasis [42]. in this context, we have shown that fluconazole and voriconazole are effective against an increasing number of yeasts and moulds [43]. the in vitro results of the present study are therefore likely to be representative of the sensitivities of strains in india. in a study conducted at 36 centres in india, variations in the in-vitro susceptibility patterns to commonly used anti-tubercular drugs among mtb strains collected in the country from 2003 to 2004 were reported [48]. resistance to pyrazinamide has increased from 12.5% in 2003-2004 to 17. the remaining products are used for the preparation of dosage forms, including tablets, capsules, tablets, and gummi pharma and kelp-base [supplementation] for brain and whole-body toning. many pharmaceutical companies use daily doses of standardized extracts up to a maximum of 1.5 g per day. 5ec8ef588b
